Theoretical context

The [Standard Model \(SM\)](#) of particle physics is a theoretical framework that describes the electromagnetic, weak and strong nuclear interactions between elementary particles. Based on the principles of [Quantum Field Theory \(QFT\)](#), it has been tested extensively and has been able to describe the observations of particle physics experiments with great accuracy. However, there are several phenomena that the [SM](#) is not able to explain, such as the existence of [Dark Matter \(DM\)](#) or the matter-antimatter asymmetry in the universe. For reasons we will discuss later, many tensions with the [SM](#) have been previously observed when quark's flavour transitions occur, such as in the $b \rightarrow sl^+l^-$ or $b \rightarrow c\tau\nu$ transitions. In this chapter, we will first introduce the theoretical framework behind the [SM](#) and its limitations [\(1.2\)](#), which will lead us to the formulation of the [SM](#) as an [Effective Field Theory \(EFT\)](#) [\(1.3\)](#) and the study of the $b \rightarrow s\nu\bar{\nu}$ transition [\(1.4\)](#), which is the focus of this thesis. Finally, we will mention [New Physics \(NP\)](#) models which could intervene in the $b \rightarrow s\nu\bar{\nu}$ transition and the experimental constraints on these models [\(1.5\)](#).

1.1 The Standard Model of particle physics

1.2 The Standard Model of particle physics

1.3 An Effective Field Theory approach to the Standard Model

1.4 The $b \rightarrow s\nu\bar{\nu}$ transition in the Standard Model

1.5 New Physics models in the $b \rightarrow s\nu\bar{\nu}$ transition
